Data Cleaning

Data cleaning is a common and very important task when working with data.

What you need to do:

First: Open the three data sets below

XLS	XLS	XLS
Reaction Types	**Reactions**	**Content**
Click to download file →	Click to download file →	Click to download file →

Second: Clean the data by:

- removing rows that have values which are missing,
- changing the data type of some values within a column, and
- removing columns which are not relevant to this task.
  - *Think about how each column might be relevant to the business question you're investigating. If you can't think of why a column may be useful, it may not be worth including it.*

Your end result should be three cleaned data sets.

If you get stuck, we'll provide some guidance in the next step. But we encourage you to give it a go first!
